

ABSTRACT OF THE DISCLOSURE

A cylindrical ornamental body can protect a reflective member from being damaged and reducing production cost. The cylindrical ornamental body comprises a transparent cylindrical main body made of synthetic resin and a reflective member having a reflective face inserted into said cylindrical main body. An air layer is provided between the reflective face of the reflective member and an inner wall of the cylindrical main body. The reflective member is composed of a belt-like member having the reflective face on at least one face thereof and has a fixing portion which is fixed to the inner wall of the cylindrical main body at least along a side edge in the length direction thereof. A attaching portion may be provided integrally on part of an outer side face of the cylindrical main body along a longitudinal direction of the cylindrical main body.
